

Plug-In®-Label represents the first time that price-labeling equipment can be controlled fully automatically, thanks to the interaction between label and machine. Each label contains a unique identification code which enables the labeler (GLM-I evo) to independently activate itself based on PLU data.

High performance
with a wide range of
solution and options.

Product Description

Plug-In®-Label is not a label, nor is it a machine. Instead, it is a combination of both, representing a self-contained system solution.

At the core of the solution, each label carries a Plug-In®-Label code which contains all essential information about the label (label specifications and SAP number) and the machine parameters. By this two-dimensional barcode the label can be uniquely identified and verified as authentic, which then enables the machine to access the relevant product's PLU data and to automatically set individually, enabling printing area, printing speed and other product-specific parameters to be adapted without requiring intervention from a machine operator.

It is also possible to perform a cross-check to verify that the right PLU is assigned to the right label, thus eliminating the risk of incorrect labeling.

The use of original parts extends the solution's useful life and hence reduces the total cost of ownership.

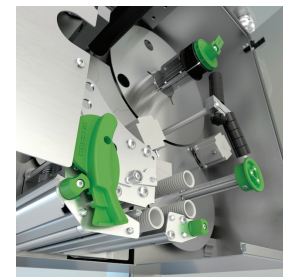

Plug-In®-Label roll

Highlights

- Label information can be used for label management
- Increase of label throughput of 20% through printing speed of 300mm/sec
- Automatic machine set-up
- Logic test (right label with right product)
- Originality check (use of original material achieves best labeling performance and machine functionality)
- Lower TCO (Total Cost of Ownership:-> costs per pack handled)
- Labeling material check (BRL 90 enables high-speed mode which is not supported by BRL 70)
- Minimum downtime / maximum machine utilization
